Fig. 376 shows a skeleton view of a double coil instrument, the dotted lines showing the connection to the terminals, the coil in the base, and the moving coil. Consider now the action of the voltmeter in the light of Ohms law. American Telephone Journal. Assume an instrument of 1,000 ohms in the moving coil and 9,000 in the stationary one, total 10,000 ohms. Suppose this be connected to ten cells of storage battery, giving a known electro-motive force of 20 volts. The resistance of the wires from the voltmeter and the battery is so small in comparison with the 10,000 ohms of the instrument that they may be neglected, and taking Ohms formula we have $E = 20$ volts, $R = 10,000$ ohms, $20 C = .002$ amperes. 10,000 This is the current which passes through the voltmeter. The needles will deflect say about an inch, and as the battery gives 20 volts, we mark the point on the scale under the needle 20. If now we double the battery to 40 volts, .004 ampere will flow, the needle will deflect two inches and the scale be marked 40. Thus we see that where the voltmeter has a very high resistance compared to the source of electricity, the current which passes through it is exactly proportional to the voltage, and as the deflections of the needle are proportional to the current they are equally proportional to the voltage....
